

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Berlepsch and Peters on Birds from Curaçao.¹—Having received a number of birds collected on Curaçao by Herr Peters, Graf von Berlepsch has made this collection the basis for an extended review of the relationships of the birds of this island. A synopsis of the previously existing literature referring to the avifauna of the island is followed by analyses of the birds found there, which show their continental and West Indian affinities. In explanation of the singular distribution of *Conurus pertinax*, found only on Curaçao and St. Thomas, it is suggested that the bird may have been introduced on the latter island, a not unreasonable supposition.

The nineteen species given from the island are very fully annotated. *Cœreba uropygialis*, *Buteo albicaudatus colonus*, and *Falco sparverius brevipennis* are described as new. The list is concluded by a synoptical table which readily shows the distribution and relationships of Curaçao birds.

Herr Peter's field-notes refer to fifty-one species of which only eighteen are represented in the collection.—F. M. C.

Hartert on Birds from Aruba, Bonaire and Curaçao.²—A revolution having prevented Mr. Hartert from visiting Venezuela, as he proposed doing on his recent trip to South America, he turned his attention to the small islands of Aruba, Bonaire, and Curaçao off the Venezuelan coast. The restricted fauna of these islands is of course less attractive to the collector than the rich life of the mainland forests, which is doubtless the reason, as Mr. Hartert states, for their comparative neglect by naturalists. We may be thankful, therefore, that they have at last been thoroughly explored by an experienced collector. The results of this exploration have in part been announced in the Bulletin of the British Ornithologists' Club for 1892 and 1893, where *Euethia sharpei*, *Myiarchus brevipennis*, *Conurus arubensis*, and *Amazona rothschildi*, all slightly differentiated insular forms, were described. To these *Columbigallina passerina perpallida* is now added, and a plate of *A. rothschildi* is given.

Aruba, sixteen miles from Cape San Roman, is the nearest of the three islands to the continent. Mr. Hartert gives a list of twenty two land-birds and eighteen water-birds as a result of his observations in this island. *Amazona canifrons* (Lawr.) from Aruba is considered to have been based on an example of *A. ochroptera* (Gm.) "with a dirty forehead." A plate is given of the latter species. Mr. Hartert states that in *Icterus xanthornus curasaoensis* the black tail is assumed "by changing colour, not by moult, as two of my specimens clearly show." It is to be regretted
